Edgenuity

Warm-Up | Ionic Bonding

Lesson Objectives

By the end of this lesson, you should be able to:

- Explain how ionic bonds form.
- Explain that ionic compounds form _____ lattices.
- Describe how _____ ions form ionic bonds with other ions.
- Explain how ionic bonds affect the properties of ionic compounds.

Science Practice: Explain the process by which ionic bonds form.

Words to Know

Fill in this table as you work through the lesson. You may also use the glossary to help you.

ionic bond	a bond resulting from the _____ between oppositely charged ions
cations	positively charged particles (typically _____)
anions	_____ charged particles (typically nonmetals)
crystal	a solid in which the particles are arranged in a _____, repeating pattern
crystal lattice	a three-dimensional _____ of points that represents the alternating patterns of atoms or ions in a crystal

Warm-Up | Ionic Bonding

Words to Know

formula unit	an electrically neutral group of ions joined by ionic bonds; the smallest unit of an [ ] compound
polyatomic ion	an ion that is made up of two or more atoms bonded together, acts as a single unit, and has an overall electric [ ]
lattice energy	the energy released when [ ]-phase ions combine to form crystals; the change in enthalpy that occurs when gaseous ions condense to form one mole of an ionic solid

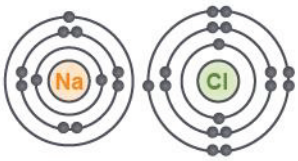
Slide 1

Lesson Question

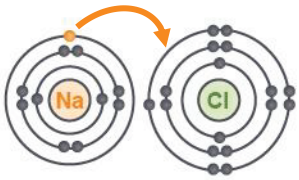
Slide 2

Ionic Bonds

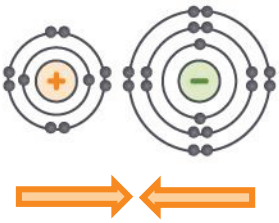
An **ionic bond** is an attraction that holds two _____ charged ions together.



Metal and nonmetal atoms



Transfer of electrons to form **cations** (positively charged) and _____ (negatively charged)



Electrostatic attraction between _____

Slide 4

Crystals and Crystal Lattices

Ionic compounds form **crystals**.

- **Crystal**: a solid in which the particles are arranged in a regular, repeating _____
- **Crystal lattice**: a three-dimensional structure of points that represent the alternating patterns of _____ or ions in a crystal

Instruction | Ionic Bonding

Slide 4

Formula Units

The [ ] formula for an ionic compound is called a **formula unit**.

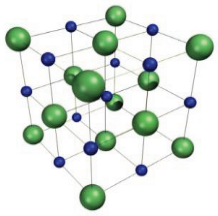
- Smallest repeating unit of an [ ] compound
- Simplest [ ] of ions in the crystal lattice

Ionic compounds do not form molecules.

NaCl: 1 Na^+, 1 Cl^-

$CaCl_2$: 1 Ca^{2+}, 2 Cl^-

Al_2O_3: 2 Al^{3+}, 3 O^{2-}



Slide 6

Compounds with Polyatomic Ions

A **polyatomic ion**:

- is a single [ ].
- is made of atoms that are bonded together [ ].
- has a [ ] that is distributed over the entire unit.
- forms ionic bonds with other [ ].

Instruction | Ionic Bonding

Slide 6

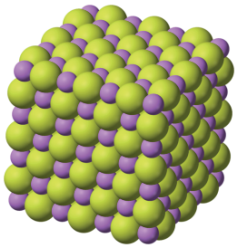
Common Polyatomic Ions

- Most polyatomic ions are anions, meaning that they're _____.
- Many polyatomic ions differ only in the number of hydrogen or oxygen _____. This affects how they are named.
  - Sulfite and sulfate differ in the number of oxygen atoms.
  - Nitrite and nitrate differ in the number of oxygen atoms.
  - Carbonate and bicarbonate or hydrogen carbonate differ in their hydrogens.

11

Forming Crystal Lattices

Lattice energy is the _____ released when _____ ions combine to form crystals. Lattice energy is a measure of the _____ strength. The energy of a crystal lattice is actually lower than the individual discrete molecule, making it more stable. It's the result of the attraction between negative and positive ions.



Lithium _____

Nitryl fluoride

Instruction | Ionic Bonding

Slide 11

Lattice Energies

Lattice energy is:

- greater for [ ] ions.
- greater for ions with larger [ ].
- a measure of the bond energy/strength.

Compound	Lattice Energy (kJ/mol)
LiF	–1,036
LiCl	–853
NaF	–923
NaCl	–786
KF	–821
KCl	–715
$CaCl_2$	–2,258

13

Ionic Bonding Affects Properties

Lattice [ ] affects the properties of ionic compounds.

- High melting and [ ] points
- Hard
- Varying solubility
- Low conductivity as [ ]; high conductivity as liquids or in [ ]

Summary | Ionic Bonding

Lesson Question

How do ionic bonds form between atoms?

Answer

Slide 2

How Ionic Compounds Form

- Ionic bonds form by the _____ of electrons from atoms.
- Metals lose electrons to become cations; nonmetals gain electrons to become _____.
- The resulting cations and anions form the ionic bond as a result of electrostatic attraction, with an electronegativity difference greater than 1.7.
- The formula unit of an ionic compound represents the simplest ratio of ions in the crystal lattice, not in a molecule.
- The atoms in a polyatomic ion are bonded together covalently and the charge is distributed over the entire ion, which acts as *one* ionic unit.

Summary | Ionic Bonding

Slide 2

Properties of Ionic Compounds

- Lattice energy is the energy released when gas-phase ions combine to form crystals.
- [ ] energy is a measure of bond strength.
- Lattice energy depends on the [ ] and charge of the ions.
- The nature of ionic bonding affects the properties of ionic compounds.
- Ionic compounds tend to be hard, have high boiling and melting points, and a range of solubility.
- Ionic compounds can conduct electricity as liquids or when ions are in water solution.
