Warm-Up | Fossils

Lesson Question

Lesson Goals

Explain how fossils form.

Differentiate types of _____.

Explain how fossils show Earth's changes over time.

Words to Know

Write the letter of the definition next to the matching word as you work through the lesson. You may use the glossary to help you.

_____	petrified fossil	A. a fossil of an organism's activity, such as a footprint, a burrow, or scat
_____	trace fossil	B. the extinction of a large number of species in a short amount of time
_____	mass extinction	C. a scientist who studies fossils
_____	paleontologist	D. an organism whose remains have been replaced over time by minerals
_____	cast	E. a hollow fossil that marks the shape of an organism
_____	carbon film	F. a fossil copy of the original organism
_____	mold	G. a rock with a coating of only the carbon from an ancient organism's body

Warm-Up | Fossils

Sedimentary Rock

[ ] usually form in sedimentary rock.

- Sedimentary rock is made of small particles of [ ], rocks, and [ ].
  - Sediment becomes [ ] (pressed together) and cemented to form a rock.
- Examples include shale, sandstone, and breccia.

Instruction | Fossils

Slide 2

Fossil Formation

A fossil is the preserved remains of a living thing.

- Fossils form when organisms are buried under [ ].
- The sediment then hardens into rock and preserves the organism's [ ].

Making a Fossil

Fossils can form when sediments build up in still water over dead [ ] and [ ].

- Soft parts, such as skin and muscle tissue, decay.

- [ ] parts remain, are protected from decay, and form fossils.

Instruction | Fossils

Slide 4

Molds and Casts

Several types of fossils can be found in [ ] rock.

Molds are hollow forms in sediment that mark the shape of an [ ].

Casts are the opposite of molds. Casts are [ ] copies of the original organism.

Petrified Fossils and Carbon Films

Petrified fossils and **carbon films** can [ ] organisms.

Petrified fossils are the remains of [ ] organisms that turn into [ ].

Carbon films are carbon [ ] from decayed organisms left behind on rocks.

Instruction | Fossils

Slide 4

Trace Fossils

Trace fossils reveal activities of [ ] organisms.

- Trace fossils include:
  - footprints.
  - [ ] remains.
  - trails.
  - burrows.

Preserved Remains

Some fossils preserve an organism's [ ] body with little or no [ ].

- Preserve soft [ ]
- Include:
  - Amber (fossilized tree sap)
  - Tar pits
  - Ice and [ ]

Instruction | Fossils

Slide 7

Paleontologists

Scientists who study fossils are called **paleontologists**.

- They study [ ] from all over the world.
- They classify organisms:
  - by [ ].
  - by time period.
- Paleontologists created the fossil record, which provides [ ] about the history of life.

Evidence for Evolution

Slide 7

Evidence of Change to Earth's Surface and Climate

Fossils provide evidence that Earth's surface and climate have changed.

- _____ study tiny fossils in _____ core samples to:
  - determine _____ levels, temperature, and _____ content.
  - analyze elements to learn about _____ in the area.
  - understand _____ in climate over time.

9

Evidence of Plate Movement

The distribution of fossils provides evidence of _____ plate _____.

- The same _____ are found on these continents.
- This suggests that the _____ were once joined.

Evidence of Extinct Organisms

The fossil record indicates that many organisms have become extinct.

- Fossils of countless extinct _____ have been _____.
  - Examples: dinosaurs, woolly mammoths, saber-toothed tigers, giant sloths, trilobites
- Fossils also indicate several instances of _____.

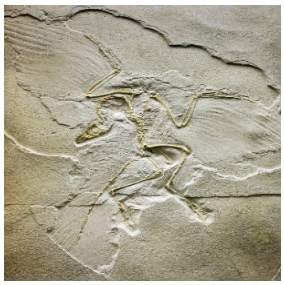
Instruction | Fossils

Slide 9

Evidence of Developmental Changes

Some fossils help us understand that _____ have changed over _____.

Compsognathus – short hairlike feathers



Archaeopteryx - long _____ feathers

_____ – modern feathers and wings

Slide 11

The Geology of Virginia

The landmass of Virginia includes _____ crust, ocean crust, _____, volcanic material, _____ from seafloor spreading, and _____ from ancient seas.
